New functions and addendum

Due to software upgrade, the following functions have been added and changed to this product.

Firmware Ver.1.031fM

1. A manual pairing function has been added PR201 PR204

Until now, the receiver side unit has automatically detected the camera side unit using the automatic pairing function. Now, the manual pairing function has been added so that the camera side unit to be connected to can be manually specified. This document describes the procedures to configure manual pairing as well as the procedures to revert back to automatic pairing.

Configuring manual pairing

When the receiver side unit cannot automatically pair to the camera side unit, use manual pairing.

- * Automatic pairing may not be able to be used when a receiver side unit that is connected to a long coaxial cable is operated together with other receiver side units.
- * For information about how to display the maintenance screen, refer to "Maintenance Screen of coaxial LAN converter" in the Operating Instructions.
- * Before configuring manual settings for the receiver side unit, connect the receiver side unit to the camera side unit and turn on the power. Turn off the power for the other receiver side units.

- * [Camera side unit set by following settings will be connected.] is selected ⑥. Confirm that "Registered" is displayed in the [Settings] field ⑦.
- * Even if an unexpected MAC address is displayed, there is no problem if "Not Connected" is displayed in the [Status] field.

Configuring automatic pairing

When a camera side unit is replaced or added, first revert back to automatic pairing, and then use manual pairing again afterwards.

- * If there are no other receiver side units, it is OK to keep using automatic pairing without going back to manual pairing.
- * For information about how to display the maintenance screen, refer to "Maintenance Screen of coaxial LAN converter" in the Operating Instructions.
